       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score

CC -!- FUNCTION: Functional neuronal receptor which couples to

Intracellular signaling pathway through the GTP-binding protein

CC G(0) (By similarity).

CC --- SUBCELIULAR LOCATION: Type I membrane protein.

CC --- SIMILARITY: Belongs to the APP family.
                                                                                                                                                                                                                    ş

Brain Res. Mol. Brain Res. 10:299-305(1991).

-!- FUNCTION: Functional neuronal receptor which cintracellular signaling pathway through the GT G(0) (By similarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the APP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           use

neurite growth, neuronal adhesion and axonogenesis. Involved in cell mobility and transcription regulation through protein-protein interactions (By similarity). Can promote transcription activation through binding to AppBl/Tip60 and inhibit Notch signaling through interaction with Numb (By similarity). Couples to apoptosis-inducing pathways such as those mediated by G(0) and JIP (By similarity). Inhibits G(0) alpha ATPase activity (By similarity). Acts as a kinesin I membrane receptor, mediating the axonal transport of beta-secretase and presenilin I (By similarity). May be involved in copper homeostasis/oxidative stress through copper ion reduction (By similarity). In vitro, copper-metallated APP induces neuronal death directly or is potentiated through Cu(2+)-mediated low-density lipoprotein oxidation (By similarity). Can regulate neurite outgrowth through binding to components of the extracellular matrix such as heparin and collagen I and IV (By similarity). The splice isoforms that contain the BPTI domain possess protease inhibitor activity (By similarity).

-i-FUNCTION: Beta-amyloid peptides are lipophilic metal chelators with metal-reducing activity. Bind transient metals such as copper, zinc and iron. Beta-amyloid psptides bind to lipoproteins and apoliproteins E and J in the CSF and to HDL particles in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10-OCT-2003 (Rel. 42, Last sequence update)

plasma inhibiting matal-cately and oxidation of ipoproteins.

PRINCIPION implicating matalia and may regulate neurite outgrowth in the brain [59 similarity).

PRINCIPION: The gamma-CTP peptides as well as the caspase-cleaved peptides; including clt, are potent enhancers of neuronal application including clt, are potent enhancers of neuronal peptides; including clt, are potent enhancers of neuronal peptides; including clt, are potent enhancers of neuronal peptides; including clt, are potent enhancers of neuronal periods. A family, mapped periods and path (may similarity). Also interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts with GCC-like protein sph. peril. Appel, lil. RNS2 interacts and lil. RNS2 interacts and lil. RNS2 interacts lil. RNS2 i

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      e European E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             serine residués is neuron-specific (By similarity). Phosphorylation can affect APP processing, neuronal differentiation and interaction with other proteins. PYM: Extracellular binding and reduction of copper, corresponding oxidation of Cys-144 and Cys-158, and of a disulfide bond (By similarity). MISCELLANEOUS: Chelation of metal ions, notably copprinc, can induce histidine-bridging between beta-amy resulting in beta-amyloid-metal aggregates. SIMILARITY: Belongs to the APP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: Phosphorylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       X97631;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
    -i-FUNCTION: Functions as cell surface receptor and performs physiological functions on the surface of neurons relevant to neurite growth, neuronal adhesion and axonogenesis. Involved in cell mobility and transcription regulation through protein-protein interactions (by similarity). Can promote transcription activation through binding to APBHJ/Tip60 and inhibit which signaling through interaction with Numb (By similarity). Complete transcription activation through binding to APBHJ/Tip60 and inhibit Norch signaling through interaction with Numb (By similarity). May be involved in copper homeostasis/oxidative stress through copper for beets secretase and presentiin 1 (By similarity). May be involved in copper homeostasis/oxidative stress through copper ion reduction. In vitro, copper-metallated App induces neuronal tendential through binding to components of the extracellular matrix such as heparin and collagen I and IV (By similarity). The splice isoforms that contain the BPII domain possess protease inhibitor activity (By similarity). Can regulate extracellular matrix such as heparin and collagen I and IV (By similarity). The splice isoforms that contain the BPII domain possess protease inhibitor activity (By similarity). Can regulate such as copper, zinc and iron (By similarity). By similarity). The splice isoforms that cransient metals such as copper, zinc and iron (By similarity). By similarity). The possess (By similarity). Bind (By similarity). The possess (By similarity). Bind (By similarity). The populasmic proteins, including APBB family members, the APBA family markets with microtubules in the presence of ATP similarity). Associates with microtubules in the presence of ATP similarity. APBPI (By similarity). ANASCE (Via as Kinda MAPF via the MT-binding domains (By similarity). ANASCE (Via Bass) and DDB1. In vitro, it binds MAPF via the MT-binding domains (By similarity). ANASCE (Via Bass) and DDB1. In the presence of ATP similarity and surface surface lutar replicate surface. Some APP accumulates in ter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NÜCLEOTIDE SEQUENCE (ISOFORMS APP695 AN TISSUE-Cerebellum; PubMed=1905108; MEDLINE=91273117; PubMed=1905108; Podlismy M.B., Tolan D.R., Selkoe D.J.; Podlismy M.B., Tolan D.R., Detcein perportes a primate model for beta amyloid especies."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   proteins (By similarity).

MISCELLANEOUS: Chelation of metal ions, notably copper, iron and zinc, can induce histidine-bridging between beta-amyloid molecules resulting in beta-amyloid-metal aggregates (By similarity).

Extracellular zinc-binding increases binding of heparin to APP and inhibits collagen-binding (By similarity).

SIMILARITY: Belongs to the APP family.

SIMILARITY: Contains 1 BPTI/Kunitz inhibitor domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        similarity). Cleaved by caspases during neuronal apoptosis (By similarity). Cleavage at Asp-739 by either caspase-3, -8 or -9 results in the production of the neurotoxic C31 peptide and the increased production of beta-amyloid peptides (By similarity). PTM: N- and O-glycosylated (By similarity) and PTM: Phosphorylation in the C-terminal on tyrosine, threonine and serine residues is neuron-specific. Phosphorylation can affect App processing, neuronal differentiation and interaction with other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PTM: Proteolytically processed under normal cellular conditions. Cleavage by alpha-secretase or alternatively by beta-secretase leads to generation and extracellular release of soluble APP peptides, S-APP-alpha and S-APP-beta, respectively, and the retention of corresponding membrane-anchored C-terminal fragments C83 and C99. Subsequent processing of C83 by gamma-secretase yields P3 peptides. This is the major secretory pathway and is nonamyloidogenic. Alternatively, presenilin/nicastrin-mediated gamma-secretase processing of C99 releases the amyloid beta proteins, amyloid-beta 40 (Abeta40) and amyloid-beta 42 (Abeta42) major components of amyloid plaques, and the cytotoxic C-terminal fragments, gamma-CTF(50), gamma-CTF(57) and gamma-CTF(59) (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       phosphorylated proteins is required for the specif

cell mobility and transcription regulation through protein-protein interactions (By similarity). Can promote transcription activation through binding to APBH/Tip60 and inhibit Notch signaling through interaction with Numb (By similarity). Couples to apoptosis-inducing pathways such as those mediated by G(O) and JIP (By similarity). Inhibits G(O) alpha ATPase activity (By similarity). Acts as a kinesin I membrane receptor, mediating the axonal transport of beta-secretase and presentin 1 (By similarity). May be involved in copper homeostasis/oxidative stress through copper ion reduction (By similarity). In vitro, copper-metallated APP induces neuronal death directly or is potentiated through Cu(2+)-mediated low-density lipoprotein oxidation (By similarity). Can regulate neurite outgrowth through binding to components of the extracellular matrix such as heparin and collagen I and IV (By in Res. Mol. Brain Res. 10:299-305(1991).
FUNCTION: Functions as a cell surface receptor and performs
physiological functions on the surface of neurons relevant similarity) neurite growth, neuronal adhesion and reaction analysis." axonogenesis. performs Involved 6

FUNCTION: Beta-amyloid peptides are lipophilic metal with metal-reducing activity. Bind transient metals copper, zinc and iron (By similarity).
FUNCTION: The gamma-CTF peptides as well as the casp peptides, including C31, are potent enhancers of neu apoptosis (By similarity).
SUBUNIT: Binds, via its C-terminus, to the PID domains. are lipophilic metal chelators **Buch** aß

caspase-cleaved neuronal

1 ÷ the PID domain 얁 several

cytoplasmic priceins, including ApBB family members, the ApBA family, MAPKBIP1, and SHC1, Numb and Dabi (By similarity). Binding family, MAPKBIP1, and SHC1, Numb and Dabi (By similarity). Binding to Dabi inhibits its serine phosphorylation (By similarity). Also interacts with GPCR-like protein BPP, FPRLI, APPBP1, IB1, KNS2 (via its TPR domains) (By similarity), APPBP2 (via BaSS) and DDB1. In vitro, it binds MAPT via the MT-binding domains (By similarity). Associates with microtubules in the presence of ATP and in a kinesin-dependent manner (By similarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein. Cell surface protein that rapidly becomes internalized via clathrin-coated pits. During maturation, the immature APP (N-glycosylated in the endoplasmic reticulum) moves to the Golgi complex where complete maturation occurs (O-glycosylated and sulfated). After alphasecretase cleavage, soluble APP is released into the extracellular space and the C-terminal is internalized to endosomes and lavosomes. Some APP accumulates in secretory transport vesicles leaving the late Golgi compartment and returns to the cell surface. Gamma-CTF(59) peptide is located to both the cytoplasm and nuclei of neurons (By similarity).

-!- DOMAIN: The basolateral sorting signal (BaSS) is required for sorting of membrane proteins to the basolateral surface of epithelial cells (By similarity) found in many tyrosine-phosphorylated proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the proteins is remitted for the senorific hinding of the protein is remitted for -

phosphorylated proteins is required for the specific binding or the PID domain. However additional amino acids either N- or C-terminal to the NPXY motif are often required for complete interaction. The PID domain-containing proteins which bind APP require the YENPTY motif for full interaction. These interactions are independent of phosphorylation on the terminal tyrosine are independent of phosphorylation on the terminal tyrosine are independent of phosphorylation on the terminal tyrosine endocytosis (By similarity).

PTM: Proteolytically processed under normal vollence excretase Cleavage by alpha-secretase or alternatively by beta-secretase leads to generation and extracellular release of soluble APP peptides, S-APP-alpha and S-APP-beta, respectively, and the retention of corresponding membrane-anchored C-terminal fragments, C83 and C99. Subsequent processing of C83 by gamma-secretase vields P3 peptides. This is the major secretory pathway and is

nonamyloidogenic. Alternatively, presenilin/nicastrin-mediated gamma-secretase processing of C99 releases the amyloid beta 2 (Abeta42), major components of amyloid plaques, and the cytotoxic C-terminal fragments, gamma-CTF(50), gamma-CTF(57) and gamma-CTF(59) (By similarity).

C: IPTM: Proteolytically cleaved by caspases during neuronal apoptosis (By similarity). Cleavage at Asp-739 by either caspase-3, -8 or -9 results in the production of the neurotoxic C31 peptide and the increased production of beta-amyloid peptides (By similarity).

C: IPTM: N- and O-glycosylated (By similarity).

C: IPTM: Phosphorylation in the C-terminal on tyrosine, threonine and serine residues is neuron-specific. Phosphorylation can affect App processing, neuronal differentiation and interaction with other proteins (By similarity).

C: IPTM: Extracellular binding and reduction of copper, results in a corresponding oxidation of Cys-144 and Cys-158, and the formation of a disulfide bond (By similarity).

C: INSCELLANDEOUS: Chelation of metal lons, notably copper, iron and resulting in beta-amyloid-metal aggregates (By similarity).

C: SIMILARITY: Belongs to the App family.

C: SIMILARITY: Contains 1 BPT/Kunitz inhibitor domain.
